The subcellular localization of the yeast DNA replication complex is regulated by the glucose concentration. Using immunofluorescence we have shown that the nuclear localization of the subunit RPA195 of the pre-replication complex is cell cycle regulated. Furthermore, the recruitment of this complex to chromatin is delayed in the presence of glucose. This means that the localization of the RPA195 protein can be modulated by environmental conditions. In order to determine which process is responsible for the delayed recruitment of RPA195 in the presence of glucose, we have tested whether changes in chromatin structure due to this condition affects the recruitment of RPA195. We found that RPA195 is only delayed when cells are grown in the presence of low concentrations of glucose. This effect is reversed when glucose is depleted from the growth medium. As such, the results indicate that an increase in intracellular glucose levels causes a delay in RPA195 recruitment to chromatin and DNA replication can only occur when cells are exposed to glucose.

Jun 14 2018 Team EMRE: A tool for early visual detection of abnormalities in cranial computed tomography studies. Introducing Team EMRE. We started with a humble and bold goal: to enable primary health care providers to detect the presence of mild-to-moderate-intensity brain injuries in the neonatal period as soon as possible, without requiring additional, expensive diagnostic tools. As of today, we are a team of a few people working on a mobile application for iOS which makes use of sensor and image processing technologies to find non-visible patterns, which can be used to detect anemic white matter and elevated intracranial pressure in cranial computed tomography (CT) studies. The technique behind Team EMRE is based on the following principle: When sections of the brain are compressed, non-visible white matter (WM) and grey matter (GM) distinctions can be seen when using contrast. As is known, in order to perform this task the image needs to be optimally contrasted and processed using an artificial intelligence algorithm. The new and innovative technique of non-visible brain scans was developed, by using the power of artificial intelligence, in order to assist in the timely diagnosis of severe brain injuries, such as traumatic brain injury and neonatal-hyp
