Tunable Cu:ZnS nanoparticles with tunable sizes and shapes and their visible light-driven photocatalytic activity. We report a versatile approach to prepare high-quality tunable Cu:ZnS (Cu:ZnS) nanoparticles with a size ranging from 5 to 16 nm and a cubic shape. The Cu(2+) and Zn(2+) precursors with different compositions were used as seed materials, and excess PbO and Al(2)O(3) were added to ensure a single phase structure. The plasmonic effect of Cu:ZnS nanoparticles was verified, and the results suggested that the particle size can be tuned from 5 to 16 nm by controlling the seeding ratio. The photoluminescent enhancement effect was verified, and the effect of the substrate on the photoluminescence was
