### **Pro Flight Simulator 2012 Serial Number Download**

With the latest update, Microsoft released the first trailer for "The Three Flavours of Deep Space" and "Galactic Civilizations III", a new sci-fi real time strategy game that is "nigh on the equal of its predecessors." The first trailer shows the state of the Milky Way and the Andromeda Galaxy, but the most exciting item that is shown is a view from outside of a black hole. In the third trailer, it is shown how the new game works with real time planet generation and how resources are spread throughout the entire game world. The game is fully freeware and is built with the Unity game engine. In the time after the release of Galactic

---

Civilizations III, a third installment of the series is expected. The game will be made in the same fashion as the previous titles, combining real time strategy and exploration and will feature both the Milky Way and Andromeda Galaxies. It's up to the player to claim as many resources as possible and to leave or mine minerals to build up a civilization.

The mass of the black hole at the centre of the galaxy The black hole is several times larger than our sun and is more than one million times more massive than the Earth. This is a gigantic star.

Black holes are the remains of dead stars. The matter of the star collapses onto itself to a point and is in effect ripped apart. This dramatic event is called a "supermassive black hole". The matter that does not collapse is thrown out into space with a huge velocity. It can be more than 2,000 miles per second. The gravity of the black hole sucks in the matter of the star, so that nothing can escape. It is very dense; you can't even look into it. Even light can't escape. The matter that gets sucked into the hole collapses. This is like a spherical object that grows endlessly, reaching a maximum of about 25 miles (40 km) in diameter. There is not enough energy to keep the black hole growing indefinitely. The matter that gets sucked into the hole must be ejected as a jet of particles

---

and electromagnetic radiation at high velocity. In the next step of the calculation, we see the path of a photon from the sun to Earth. The results show that the photon made a complete circle and doubled its velocity: the photon travels faster than light. This phenomenon is called "superluminal travel" and is technically correct, but it would mean that the existence of the photon is impossible in our world and that it should be possible c6a93da74d
